Klebsiella mastitis is one of the most devastating emerging diseases in the dairy industry. Klebsiella is a Gram-negative bacteria associated with environmental mastitis in cattle, which means it can be found almost anywhere and can cause infection through contact. Fecal shedding into the environment coupled with various types of bedding create an ideal growing condition for the survival and transmission of Klebsiella bacteria. Dairy cattle that are not culled from the herd due to Klebsiella mastitis typically have recurring infections that are costly to the dairy.

INDICATIONS: This product has been shown to be effective for vaccination of healthy cattle 22 months or older against mastitis caused by Klebsiella pneumoniae. For more information regarding efficacy and safety data, see productdata.aphis.usda.gov.

DIRECTIONS: Shake well before use. Administer 2 mL (1 dose) subcutaneously. Re-vaccinate in 2-4 weeks. Heifers should receive their first dose 30 days after calving. Dry cows should be vaccinated twice before calving. Whole-herd vaccination may be done at any stage of lactation. The need for annual booster vaccination has not been established for this product; consultation with a veterinarian is recommended.

CAUTIONS: Store at 35°F to 46°F (2°C to 8°C). DO NOT FREEZE! Use entire contents when first opened. Do not vaccinate within 60 days of slaughter. Transient swelling at the injection site >5 cm may occur. Heifers <22 months of age should not receive this product until 30 days after calving. In case of allergic response, administer flunixin meglumine and/or epinephrine. Contains formaldehyde and polymyxin-B as preservatives. Do not mix with other products.

New KLEBVax® with SRP® technology keeps cows healthy and productive.

KLEBVax SRP from Huvepharma® is the first USDA licensed vaccine for use in the management of mastitis infections caused by Klebsiella – an increasingly challenging disease in dairy cattle. Based on Siderophore Receptor and Porin (SRP®) technology, KLEBVax SRP is an exciting new tool to fight Klebsiella mastitis.

**KEY FEATURES & BENEFITS**

- KLEBVax SRP has been shown to reduce the prevalence of mastitis in the herd by 71%
- The incidence rate of a cow getting mastitis one or more times due to Klebsiella was reduced by 76%
- Vaccinated cows stay in the herd longer; regardless of mastitis infections
- Somatic cell count, an indicator of udder inflammation, was reduced by 42% in the vaccinated cattle
- 2 lb/day gain in milk production per cow, compared to non-vaccinated cows

**SRP VACCINE TECHNOLOGY**

Bacteria require iron to survive. Since most iron in a host is tied up, bacteria produce and release siderophore proteins, which scavenge iron from the local environment. These “siderophores” then bring the iron back into the bacteria through protein pores (porins) specialized for iron acquisition. These pores are referred to as siderophore receptors, or SRP proteins. A vaccine made from SRP protein will generate antibodies that block the uptake of iron into the bacterial cell.

**HOW COMMON IS KLEBSIELLA MASTITIS?**

More herds and more cows within those herds are experiencing cases of Klebsiella mastitis. The prevalence of *Klebsiella pneumoniae*- positive fecal samples from surveys done over a 12 year period in Northeast herds, have shown a 23% increase in infection detection. The number of reported cases has been steadily growing over the past 15 years, which can be attributed to the usage of recycled manure bedding, although Klebsiella can be found in sand bedding as well.

Klebsiella infections can occur at any time during the lactation period and may also occur during the dry period. Cows in early lactation are at an increased risk for new infections due to the increased stress and immune suppression associated with the postpartum period. Additionally, cows are at an increased risk for mastitis immediately after the dry off period.
